

MANIKONDA THARUN

Software Engineer - Growth & RevOps Systems

California, USA | (205)259-8634 | tharun.manikonda1@outlook.com

SUMMARY

Software Engineer focused on building product-led growth systems that connect data warehouses, CRM platforms, and automation workflows. Experienced in translating product usage signals into real-time sales actions, optimizing HubSpot architectures, and building internal tools that improve pipeline visibility and conversion. Proven ability to design scalable, developer-first GTM infrastructure that drives measurable revenue impact.

TECHNICAL SKILLS

Languages: Python, JavaScript, SQL

AI & LLMs: OpenAI API, Claude, LangChain, Prompt Engineering, RAG Systems

GTM Systems: HubSpot (Workflows, Custom Objects, APIs), Lead Routing, Lifecycle Automation

Data Platforms: BigQuery, Snowflake, Hightouch (Reverse ETL), Fivetran, Data Modeling

Sales Tech: Outreach, Salesloft, Gong, ZoomInfo, Clearbit

Automation: APIs, Webhooks, Cloud Functions, n8n, Workflow Orchestration

PLG Systems: Product-Led Signals, Event Tracking, Usage-Based Triggers, Funnel Analytics

Internal Tools: Slack Bots, Dashboards (Hex), Micro-Apps, Sales Enablement Tools

Architecture: Event-Driven Systems, Idempotent Processing, Schema Evolution

Observability: Data Quality SLAs, Pipeline Monitoring, Logging, Failure Handling

Core Engineering: System Design, Debugging, Integration Design, Scalable Systems

PROFESSIONAL EXPERIENCE

McKinsey & Company | CA, USA

Software Engineer (PLG & Revenue Systems)

May 2025 – Present

- Built PLG trigger infrastructure connecting BigQuery product usage signals to HubSpot workflows, enabling real-time lead activation and driving a 32% increase in conversion across high-intent user segments.
- Designed and maintained HubSpot architecture including workflows, custom properties, and lifecycle automation, improving lead routing accuracy by 35% and reducing manual intervention across GTM operations.
- Implemented reverse ETL pipelines using Hightouch to sync product and customer data into CRM systems, improving data freshness and enabling real-time account intelligence for sales teams.
- Developed internal dashboards in Hex to track pipeline coverage and PLG conversion metrics, improving visibility for leadership and enabling data-driven decision-making across GTM teams.
- Built lightweight internal tools and Slack bots providing AEs and BDRs with real-time account insights, improving response time and increasing engagement rates by 25% across accounts.
- Integrated AI workflows using OpenAI APIs to automate account research, meeting preparation, and summarization, reducing manual effort by 40% and improving sales productivity.
- Optimized enrichment pipelines using APIs and external data providers, improving contact data accuracy by 30% and enabling more precise targeting across outbound and inbound campaigns.

Uber | CA, USA

Software Engineer (Data & Distributed Systems)

February 2024 – May 2025

- Developed event-driven data pipelines processing over 1M daily events using distributed systems, improving data availability and enabling real-time analytics across high-scale production environments.
- Built API-driven services integrating multiple systems, improving data flow efficiency by 25% and reducing latency across distributed backend environments supporting critical operations.
- Designed SQL-based workflows and data models for analytics, improving data accuracy by 25% and enabling faster insights across engineering and operations teams.
- Implemented monitoring and logging systems for pipeline observability, reducing data inconsistencies by 20% and improving reliability across distributed systems.
- Collaborated with cross-functional teams to deliver scalable data infrastructure, improving operational efficiency and enabling seamless integration across engineering and business workflows.
- Optimized system performance through debugging and architectural improvements, ensuring scalability and reliability across backend systems supporting millions of users globally.

KPMG | India

Software Engineer (Data Systems & Analytics)

September 2021 – July 2022

- Built data pipelines and reporting systems using SQL and structured models, improving data consistency by 25% and enabling reliable integration across enterprise business workflows.
- Developed dashboards and analytics tools for stakeholders, improving visibility into key performance metrics and enabling data-driven

decision-making across business teams.

- Debugged and resolved data inconsistencies through validation and analysis, reducing errors by 20% and improving reliability across data pipelines and reporting systems.
- Collaborated with stakeholders to translate requirements into scalable technical solutions, improving system usability and alignment with operational and reporting goals.

Trigent Software | India

Frontend Developer

March 2020 – August 2021

- Developed React-based frontend applications integrated with backend APIs, improving user engagement by 20% and enabling seamless interaction across web-based platforms.
- Implemented API integrations connecting frontend interfaces with backend services, ensuring reliable data flow across distributed application components and improving system functionality.
- Debugged UI and integration issues using browser tools and logs, reducing defects by 25% and improving application stability across production releases.

PROJECTS

Enterprise AI Document Assistant (RAG System)

- Architected a Retrieval-Augmented Generation (RAG) system using Python and LangChain to automate information extraction across 5,000+ enterprise documents, achieving 92% retrieval precision.
- Implemented a vector search pipeline using Pinecone with tuned chunking strategies (512-token segments with overlap), delivering semantic search responses in under 500ms.
- Leveraged GitHub Copilot and Cursor to develop FastAPI endpoints and React.js dashboards, reducing the end-to-end development cycle by 40%.
- Integrated AWS S3 for document storage, enabling semantic search results in under 500ms for complex queries.

NotchSafe — macOS Productivity Utility

- Engineered a native macOS utility using Swift and SwiftUI that transforms the MacBook notch into an interactive hub for encrypted storage and clipboard management.
- Integrated AES-256-GCM encryption and Touch ID biometric authentication, ensuring secure file handling with zero external dependencies.
- Designed a persistent clipboard monitoring system using NSEvent, resulting in a lightweight footprint (<5MB binary) and minimal system memory usage.

SmartHealth iOS: AI-Driven Wellness Tracker

- Developed a native iOS application using Swift and CoreML to provide real-time wellness insights based on user activity and behavioral data.
- Integrated a local NLP model for automated journaling and sentiment analysis of daily health logs.

EDUCATION

Master's in Computer Science

University of Alabama at Birmingham

August 2022 – December 2023

Bachelor of Engineering in Computer Science

K.S. Institute of Technology, Karnataka, India

June 2018 – May 2022

CERTIFICATIONS

- AWS Certified Solutions Architect – Associate
- Certified MERN Developer – Namaste Dev
- Node.js Certified Developer – Coursera
